90 mm with: 21 ± 2 ml.	1 box with 2 packs of 10 plates/pack. Single cellophane.	3 months	2-14°C

Description and Technique

Description

This culture medium differs from the classical Sabouraud Agar only by the addition of chloramphenicol. This thermostable antibiotic has a broad antibacterial spectrum which ensures the selective isolation of fungi from highly contaminated samples.

This medium is also well suited for air environmental sampling (total compatibility with most commercially available air samplers) or for other types of environmental sampling (fingers or gloves of operators, swab streaking).

Technique

The technique of inoculation is by streaking methodology or by spiral method. Incubate the plates right side up aerobically at 20-25°C for up to 5 days. (Incubation times greater than those mentioned above or different incubation temperatures may be required depending on the sample, or the specifications).

After incubation, enumerate all the colonies that have appeared onto the surface of the agar. Each laboratory must evaluate the results according to their specifications.
